What's your role in VOILA? What would be the best outcome for you?

Together with Thomas Hankemeier we explore the use of microfluidic vascular models to assess the impact of factors circulating in plasma on vascular integrity and how this evolves with ageing. Metabolites or circulating factors that associate with healthy or diseased clinical phenotype could provide very useful for the understanding and monitoring of the impact of lifestyle or drug interventions ageing.

Mention your Pension. What will you be doing?

I hate to think about that, next question?
